

30-50 minutes									
Total attendees ~ 30-50 ppl; expected: 40-50									
Time	Duration	Task							
16:45-16:50	5 minutes	Objective setting and group formation	Instructions: form groups of 4-5 ppl, ideally with someone you don't know. 1) Round of introductions (30 seconds each person) 2) If there is time: icebreaker: Tell the group about something you're good at (not research/work-related) 3) Choose the topic, agree on your version of the answer to the big question. 4) Write down your answer (if <=4 groups) or type it in the web form (if >4 groups) 5) If you finalized an answer but there is time left, pick up another topic.						
16:50-17:00	30 minutes	Group discussion							
17:00-17:30	10 minutes	Plenary session	If 8 groups or less: Each group has 1 minute to give their answer(s) and briefly explain. If >8 groups: type the answers in a web form						
17:30-17:35	5 minutes	Summary							
Track	Moderators/Leads	The big question	Examples of directions for discussion						
Creating models of road user behavior		In the future, what would it take modelers to convincingly demonstrate that a model of human behavior is the right one?	-Mechanistic, data-driven, or hybrid — what does each actually buy us, and what does "hybrid" mean concretely beyond the slogan? -Is interpretability a genuine requirement, or a proxy for trust that a sufficiently well-validated black box would make unnecessary? -What data, metrics, or know-how is missing for "ideal" validation, and which of those gaps is closest to being closed? -How do we validate closed-loop behavior, where the model changes the situation it is responding to and there is no ground truth? -Does "right" mean the same thing for a model built to explain behavior and a model built to generate it?						
			- Which population/data defines competence: crash-data subsets, professional drivers, naturalistic fleet data? - Are CAC reference models mostly useful for collision/conflict avoidance, or also in routine driving scenarios? - How do we reconcile the regulator's need for simple, foolproof reference models with the fact that human behavior is very complex? - Once the number of reference models used in practice inevitably increases, how should model users navigate this landscape? - Can models of careful and competent drivers be adapted into models of other sub-populations needed to realistically represent surrounding traffic (distracted, impaired, aggressive drivers)? Or does this field need principally different models? - What other applications can benefit from road user modeling and how? Driver assistance system design, training data generation, driver monitoring, personalization?						
The use of human driver models as behavior references for AVs	No centralized moderators; if we see that some groups consist mainly of speakers, we will ask them to spread over other groups	Which important ingredient(s) is missing from current definitions of "careful and competent human driver"?							
Beyond "careful and competent driving": human behavior models for traffic simulation and other use cases		Which other application of road user modeling is most promising today? What would it take to achieve it?							
Total attendees > 30									
Time	Duration	Task							
16:45-16:50	5 minutes	Objective setting and group formation							
16:50-16:58	8 minutes	Subgroup discussion							
16:58-17:00	2 minutes	Group synthesis							
17:00-17:30	30 minutes	Group presentation and QA (10 minutes each group)							
17:30-17:35	5 minutes	Summary							
Track	Moderators/Leads	Key questions (2 max)	Suggested outcomes						
Regulation and standardization	Biagio Cuffi/Johan Engström	1. How do we operationalize concepts like "careful and competent drivers" and get regulatory approval?	Top 3 regulatory blockers for model evaluations from regulatory perspectives.						
	Kevin Kefauver	2. What are the key gaps in SAE J3330? And how can the international modeling community help?	Top 3 priorities in standardization.						
Safety evaluation of ADS	Jonas Bårgman	1. How to create benchmarking dataset with naturalistic driving data that is statistically representative?	Top 3 criteria for benchmarking datasets.						
	Yueyang or Samir?	2. How do we incorporate simple and longstanding kinematic metrics such as TTC, PET into more comprehensive scoring frameworks?	Top 3 considerations for forming scoring metrics or frameworks for ADS evaluations.						
Behavioral modeling	Gustav Markula	1. Where do data-driven methods succeed? Where do mechanistic models succeed?	Top 3 recommendations for utilizing data-driven and mechanistic models.						
	Julian or Saeed?	2. Do we need regulations or standardizations on driver models?	Top 3 regulatory blockers for behavioral modeling from modeller perspectives.						

Workshop on Computational Models of Human Road User Behavior for Evaluation of Automated Vehicles

September 15, 2026, Naples, Stazione Marittima, Room Calipso

Abstracts of contributed talks and most recent schedule are available at <https://roadusermodels.github.io/>
